

**Amendments to the Abstract**

Please delete the abstract found on the cover page of the current specification (submitted as PCT Publication WO 2005/081047 A1) and replace it with an abstract of the following text, intended to be on a separate sheet, apart from any other text of the specification:

Abstract of the Disclosure

The invention relates to foldable spectacles comprising two lenses (1a, 1b) which can be adjusted between a support position and a folded position and which are connected to each other by means of a nose piece (10). The nose piece (10) extends on a connecting axis (I) which is arranged on a plane of the spectacle lens and comprises a folding joint (15) which is used to fold the spectacles. The folding joint (15) can be rotated about a rotatable axis (m) which extends at an acute angle ( $\beta$ ) to the connecting axis (1), such that the spectacle lenses (1a, 1b) are arranged on the same plane next to each other in a folded position after a 180° rotation.
